

-- Added Report

Addendum:**Baseline assessment of Rectal cancer MRI report****Primary tumour**

The primary tumour is demonstrated as an Annular mass with a nodular infiltrating border.

The distal edge of the luminal tumour arises at a height of 92 mm from anal verge:

The distal edge of the tumour lies 60mm Above, the top of the puborectalis sling

The tumour extends craniocaudally over a distance of 95mm

The distal edge of tumour lies above the peritoneal reflection

Invading edge of tumour extends from 2 to 7 O'clock

Tumour extends through the muscularis propria:

Tumour thickness is: 27mm

Extramural spread is 17 mm

mrT stage: T3d

Tumour is not present the level of the puborectalis sling at this level:

Lymph node assessment

N1c deposits

Extramural venous invasion: Evidence definite Large vein invasion is present – superior rectal ven branches

CRM

The closest circumferential resection margin is at 7 o'clock

The closest CRM is from Direct spread of tumour/N1c and EMVi Minimum tumour

distance to mesorectal fascia: 1mm CRM involved

Peritoneal deposits: No evidence

Pelvic side wall lymph nodes: None

Summary: MRI Overall stage: T3c N1c , CRM involved , EMVI positive
PSW negative
